CASE STUDY

**MYOB
HEAD
OFFICE**

VICTORIA

Local software developer, MYOB Australia, set out to build a state of the art Head-Quarters that minimises energy consumption and maximises staff comfort levels. The result is their Energy Smart award winning corporate building in Burwood.

Essential to this mix of environmental sustainability and increased productivity is the Managed Lighting System from ECS. This state of the art lighting control system enables each light fitting to be individually programmed, essentially creating 'intelligent luminaires'.

The Managed Lighting System is entirely automatic in its operation - Lights turn on and off automatically in response to movement and regulate to compensate for natural lighting levels. As a result, wasted energy is kept to a minimum as lighting is only on where and when required and only to the required illuminance.

This is particularly advantageous to MYOB staff, who may have different lighting requirements within each individual work space.

The MLS gives them the flexibility to alter these lighting levels to meet their individual lighting needs without affecting staff in other areas.

Another major benefit of the managed lighting system to MYOB is the remote control programming tool. This allows all programming, commissioning and modification of lighting to be carried out by MYOB themselves, saving considerable amounts of time and money.

The flexibility offered by the ECS Managed Lighting System is best highlighted when tenancy layouts change. With the MLS, no wiring changes are required even if partitions and walls are moved. The intelligent luminaires can simply be re-programmed to suit the new layout.

The ECS Managed Lighting System offers the required flexibility, control and energy savings to meet and exceed the high standards set by MYOB for this high-tech, award winning building.
